

Project Planning Bug Tracker

April 12, 2021

1 Categories of Tasks

Issue Management additions or changes:

- A **deadline** field and completed date field must be added to each issue in order to track its progress more effectively.
- Project managers should have more **control** over issues in some situations, like sending completed issues back to the backlog or removing completed issues and lastly they should be able to assign issues to developers.
- A To-do list display format will be useful for seeing issues from another perspective while also providing a better way to display issues on a smaller resolution.

Project Management additions or changes:

- Users will not be asked to choose an account type, instead each user may create or join projects and if they own a certain project they will automatically be the project manager.
- The addition of project **description**, when a user creates a project then he/she may fill in a description. And if a user hovers over a project icon or title then the description will appear.
- A **new page** dedicated to project management where the owner should be able to add users, remove users and edit the project's fields.

Notifications new feature additions:

- A new page dedicated to notifications, each user will have a list of notifications that can be removed with a button.
- Some actions will send notifications, for example if a project manager assigns a task to a user that user will receive a message that can be viewed on the notifications page.
